

HOUSE PRICE PREDICTION

Prediction of house prices using the California housing dataset through machine learning regression models.

INTRODUCTION

Collected and preprocessed the California housing dataset, performed exploratory data analysis (EDA), and built a regression model using machine learning algorithms to predict house prices based on location and socioeconomic features.

DATASET

MedInc	HouseAge	AveRooms	AveBedrms	Population	AveOccup

ML MODEL

```
x_train, x_test, y_train, y_test = train_test_split(x,y, test_size = 0.2, random_state = 42)
```

```
model = LinearRegression()  
model.fit(x_train, y_train)
```

▼ LinearRegression ⓘ ?

LinearRegression()

PREDICTED OUTPUT

Enter the house details below:

Median Income (in \$10,000s): 6.0

Median House Age: 20

Average Rooms per household: 5.5

Average Bedrooms per household: 1.0

Population of the area: 500

Average Occupants per household: 3.0 Appraisal Expert

Latitude : 34.05

Longitude : -118.25

Predicted Median House Value: 2.949 (in \$100k units)

Approx. Price: \$294,857.42

THANK YOU

The project successfully developed a machine learning model capable of accurately predicting house prices in California. It highlighted how factors are important for the house prediction in this project with greater effect
